

Exercise sheet 2

Set theory and Logic, MTH303

1. Given a sequence of propositional forms p_0, p_1, \dots that is consistent and a proposition q so that $p_0, p_1, \dots \vdash q$, is it true that the sequence q, p_0, p_1, \dots is also consistent? Justify your answer.
2. Prove that for any propositional forms p, q so that $p \implies q$, then $p \rightarrow q$ is a tautology. You will have to check this for each of the inference rules.
3. Given a sequence of propositional forms p_0, p_1, \dots and a propositional form q for which $p_0, p_1, \dots \not\vdash \neg q$, then the sequence q, p_0, p_1, \dots is also consistent.
4. Given a sequence of propositional forms p_0, p_1, \dots that is consistent and a proposition q , prove that q, p_0, p_1, \dots is also consistent, where $r = q$ or $\neg q$.
5. Given a maximally consistent sequence of propositional forms p_0, p_1, \dots if $q \rightarrow r$ for some i , and $q = p_j$ for some j , then $r = p_k$ for some k .
