Exercise sheet 3

Set theory and Logic, MTH303

- 1. Prove that $\exists x p(x), \forall x (p(x) \to q(x)) \vdash \exists x q(x)$
- 2. Prove that $\exists p(x) \to q(y) \iff \forall x(p(x) \to q(y))$
- 3. Prove that the power set of a the union of a family of sets is a set.
- 4. Show that a subset axiom implies that there can be no set of all sets.
- 5. Prove that for any function $f: X \to Y$, there is a maximal subset of X so that f restricted to that subset is 1-1.
- 6. Prove that $(X \setminus Y) \cup (Y \setminus X)$ is a set if X and Y are sets.
- 7. Prove that the cartesian product of non-empty sets is non-empty.
